

FLOATEX 'D' SCREEN

FLOATEX 'D' SCREEN

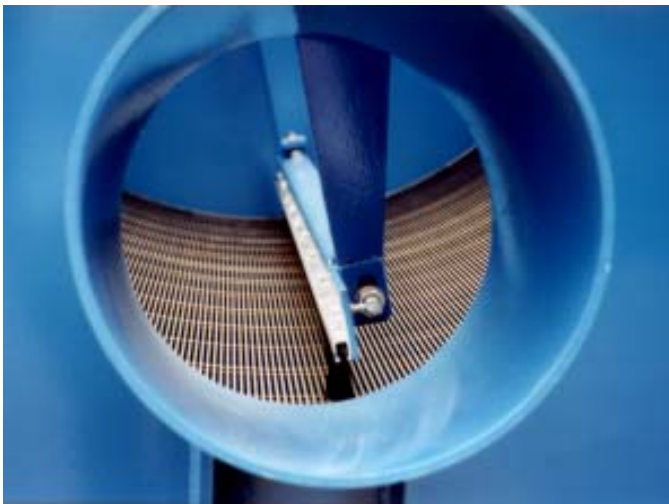

The Floatex 'D' Screen is designed for the removal of trash from a process stream where the available height is critical.

Typical applications are:

- Removal of wood, plastic, slag, stone etc.. from log washer overflows.
- Removal of fine organic material from process water.

The feed is introduced on to a curved screen deck, the water and fines pass through whilst the oversize is retained on the deck. A motorized wiper mechanism cleans this material from the deck.

A choice of screen apertures and wipers are available to suit individual application.
